Micro2003 Special Edition - EXPerience

Group Varint Encoding

- Idea: encode groups of 4 32-bit values in 5-17 bytes
  - Pull out 4 2-bit binary lengths into single byte prefix

`00 000001   00 001111   01 111111   00000111   10 111111   11111111   00000111`

`00 00 01 10   00000001   00001111   11111111   00000001   11111111   11111111   00000001`

Tags | 1 | 15 | 511 | 131071

- Decode: Load prefix byte and use value to lookup in 256-entry table:

  . . .

  `00 00 01 10` ⟶ Offsets: +1,+2,+3,+5; Masks: ff, ff, ffff, ffffff

  . . .

- Much faster than alternatives:
  - 7-bit-per-byte varint: decode ~180M numbers/second
  - 30-bit Varint w/ 2-bit length: decode ~240M numbers/second
  - Group varint: decode ~400M numbers/second
